

P200002233

ABSTRACT

Automatic coupling device for laminar bands proceeding from feeding coils, built up of two coil supports (3) and (4) which are situated in a vertical movable assembly and of both heads (6) and (7) foreseen of means for the automatic coupling between the bands coming from the coils incorporated on the coil supports (3) and (4), and whose heads (6) and (7) are movable in approximation and separation along a horizontal structure (8), while above the coil supports (3) and (4) some hanging elements are movable to withdraw the spindle of the finished coils.

TITLE

Automatic coupling device for laminar bands proceeding from feeding coils.
